

BOOK A DOCTOR SYSTEM

Roles and Responsibilities

This document explains the responsibilities of each user role and the complete workflow followed in the Book a Doctor System. The platform consists of three primary roles: Patient, Doctor, and Administrator.

1. User Registration

John, a patient in need of a routine check-up, opens the Book a Doctor application and registers by providing his email address, phone number, and password. The password is securely encrypted using bcrypt before being stored in MongoDB. After successful registration, John logs into the application using JWT-based authentication.

2. Browsing Doctors

After logging in, John accesses the Patient Dashboard and browses available doctors. He can view specialization, hospital, consultation fee, availability, and experience before selecting a doctor.

3. Booking an Appointment

John chooses a doctor, selects the appointment date and time, enters the reason for the visit, and submits the appointment request. The appointment is stored in MongoDB with an initial status of Pending.

4. Appointment Confirmation

The selected doctor reviews incoming appointment requests and confirms the appointment. Once confirmed, the appointment status changes to Confirmed and becomes visible in the patient's appointment history.

5. Appointment Management

Patients can view appointment history, monitor appointment status, and manage their bookings through the My Appointments page. They can also update profile information whenever required.

6. Administrator Responsibilities

The administrator manages doctors, patients, and appointments. The admin can add, update, or remove doctors, monitor appointment statistics, and ensure that only valid doctor profiles are available in the system.

7. Platform Governance

The administrator oversees platform security, user management, and system maintenance. JWT authentication, role-based authorization, and MongoDB data management ensure secure platform operations.

8. Doctor Responsibilities

Doctors log into their dashboard to review assigned appointments, check patient details, and update appointment statuses to Confirmed, Cancelled, or Completed. They also maintain their professional profile.

9. Appointment Consultation

On the scheduled date, the doctor consults the patient. The consultation details are reflected through the appointment status, allowing patients to track the progress of their visit.

10. Post-Appointment Follow-up

After the consultation, the doctor marks the appointment as Completed. Patients can later review their appointment history and visit details through the application.

Role Summary

Patient: Register, log in, browse doctors, book appointments, view appointment history, and manage profile.

Doctor: View assigned appointments, update appointment status, and maintain doctor profile.

Administrator: Manage doctors, patients, appointments, dashboard statistics, and overall platform administration.
