

BOOK A DOCTOR SYSTEM - USER FLOW DIAGRAM

User Flow Description

1. Registration Flow

A new user opens the landing page, selects Register, enters the required personal information, chooses a valid role, and submits the form. The account is stored in MongoDB after password hashing.

2. Login and Role Redirection

The user enters an email address and password. After successful JWT authentication, the application checks the role and redirects the user to the Patient, Doctor, or Admin dashboard.

3. Patient Flow

The patient browses available doctors, checks doctor details, selects a doctor, chooses a date and time, enters a consultation reason, and submits the appointment request.

4. Appointment Status Flow

A newly created appointment begins with Pending status. The doctor can Confirm or Cancel it. After the consultation, the doctor marks the appointment as Completed. The updated status is visible in the patient's appointment history.

5. Doctor Flow

The doctor logs in, views only assigned appointments, reviews patient information, and updates the status to Confirmed, Cancelled, or Completed.

6. Admin Flow

The administrator monitors doctors, patients, appointments, and dashboard statistics. The admin can manage user records and view the complete appointment lifecycle.

7. Appointment History

Patients can view their past and upcoming appointments, doctors can view assigned and handled appointments, and administrators can monitor all appointments.

Overall Flow: Registration -> Login -> Role-based Dashboard -> Browse Doctors -> Book Appointment -> Doctor Review -> Status Update -> Appointment History.
