

BOOK A DOCTOR SYSTEM

Project Setup and Configuration - Creating Project Folder

Objective

Create a clean project structure by separating the frontend and backend into independent folders. This improves maintainability, scalability, and supports the MVC architecture.

Steps

1. Create a new folder named **Doctor Booking System**.
2. Inside the project folder create two folders: **client** and **server**.
3. Open the project folder in Visual Studio Code.
4. Initialize Git using **git init**.
5. Create a **.gitignore** file to exclude `node_modules`, `.env` files, logs, and build files.
6. Verify the project structure before starting development.

Folder	Purpose
client	React.js frontend containing pages, components, routing, CSS, and Axios API integration
server	Node.js + Express backend containing routes, controllers, services, models, middleware,
.gitignore	Excludes <code>node_modules</code> , <code>.env</code> , logs, and generated files from GitHub.

Outcome

The project folder is organized with separate frontend and backend directories, Git version control is initialized, and the application is ready for React, Express.js, and MongoDB development.
