

SERVER SETUP - Book a Doctor System

Objective

Set up the backend server for the Book a Doctor System using Node.js and Express.js with an MVC project structure.

Implementation Steps

1. Open the **server** folder in the VS Code terminal.
2. Initialize the project using `npm init -y`.
3. Install required packages such as Express.js, Mongoose, JWT, bcrypt, dotenv, cors, helmet, morgan and nodemon.
4. Create the main server entry file **server.js**.
5. Create the project structure folders: **src/controllers**, **src/models**, **src/routes**, **src/services**, **src/middleware**, and **src/config**.
6. Configure Express middleware (CORS, Helmet, Morgan and JSON parser).
7. Connect the backend to MongoDB using Mongoose.
8. Run the backend server using `npm run dev`.

Folder Structure

```
server/  
■■■ server.js  
■■■ src/config  
■■■ src/controllers  
■■■ src/models  
■■■ src/routes  
■■■ src/services  
■■■ src/middleware
```

Expected Result

The backend server starts successfully, connects to MongoDB, exposes REST APIs, and is ready for frontend integration.
